SUPERMART GROCERY SALES DASHBOARD

Retail Analytics • Internship Portfolio Project

1. Project Overview

The goal is to turn grocery sales records into clear business insights about overall sales and profit, category and sub-category performance, discount patterns, and geographic contribution. The project follows the four objectives in the supplied SapphireIQ brief.

2. Dataset & Tools

The provided CSV contains 9,994 records and 11 fields: order ID, customer name, category, sub-category, city, order date, region, sales, discount, profit and state. Deliverables use Python/pandas for data preparation, Excel for tabular analysis, and an HTML/Chart.js dashboard for visualization.

Metric	Result
Total sales	■14,956,982.00
Total profit	■3,747,121.20
Order IDs / records	9,994
Average discount	22.68%
Overall profit margin	25.05%

3. Category Performance

By sales, the leading category is Eggs, Meat & Fish (■2,267,401.00). By total profit, the leader is Snacks (■568,178.85). Use the dashboard and workbook to compare sales contribution with profitability instead of judging performance by sales alone.

4. Geographic & Discount Analysis

The highest-sales region in the supplied file is West (■4,798,743.00). Discount levels are grouped for comparison with aggregate profit in the workbook. Correlation or grouped patterns should be treated as descriptive and not proof that discounts cause changes in profit.

5. Data Quality & Limitations

Order Date values use mixed separators; dates were normalized using day-first parsing. All records parsed successfully. The State field contains only Tamil Nadu, so state-level comparisons cannot be meaningfully performed. The source has no cost, inventory, customer-segment, or explicit order quantity field; these topics are outside the analysis scope. Discount is a rate, so average discount is more interpretable than summing it.

6. Deliverables & How to Use

Open dashboard.html in a modern browser with internet access for interactive charts. Use Supermart_Grocery_Analysis.xlsx to inspect cleaned records and analysis tabs. Run analysis.py with Python and pandas installed to reproduce core summaries. The package does not contain a Power BI .pbix file; if the

internship explicitly requires Power BI, recreate the visuals in Power BI Desktop before claiming that format was submitted.

Prepared from the supplied dataset and project brief. Findings are descriptive and should be validated with the internship supervisor before business decisions.
